

Cx - Requirement

- IBM is our new customer
- IBM is located in LONDON.
- IBM is planning to move from their on-premise Datacenter to CLOUD.
- IBM wants there application and database to be setup on AWS-Cloud

Network

- IBM wants a network/VPC with capacity of 8k servers / ip's
- IBM wants IGW connectivity to the complete VPC
- IBM wants to divide this network into two sub-networks
- IBM wants 1st subnet to be used to run Application
- 2nd subnet to be used to run database

Sub-Networks

- We need to divide the VPC into two sub-networks
- IBM wants the 1st subnet to be open for public
- IBM wants to divide this subnet with 4k - ip's
- IBM wants to run there application on this subnet

- IBM wants the 2nd subnet to closed for public, i.e a Private sub-network
- lbm wants this pvt-subnet to have 4k - ip's
- IBM wants to run database in this pvt-subnet

Routing-Traffic

- As per IBM request.
- We need to route www traffic only to the Public-Subnet
- We need to create a Public route table
- We need to attach IGW to Public Subnet

- We need to create a Private route table
- We need to attach the private subnet to the private route table

NOTE : Do not attach IGW to private resources

IBM wants the application to be accessed by public

IBM wants the DB to be accessed only by admins

IBM wants traffic distribution over multiple servers

IBM wants monitoring of there servers

IBM wants fault-tolerance , Disaster Recovery

IBM wants notifications to be sent if something goes wrong.
