
AWS Health Dashboard – Overview

What is AWS Health Dashboard?

AWS Health Dashboard provides **real-time and personalized** alerts and guidance when **AWS services** or **your AWS resources** are impacted by events such as:

-  Service disruptions
-  Planned maintenance
-  Security notifications
-  Account-specific events (e.g., EC2 retirement, quota breach)

It helps you stay **informed**, **prepared**, and **responsive** to AWS events that affect your cloud environment.

Types of Dashboards

AWS offers two levels of Health Dashboards:

1. Service Health Dashboard (Public)

- URL: <https://health.aws.amazon.com/health/status>
- Shows **current status of AWS services globally**
- No login required

- Example: "EC2 in us-east-1 experiencing increased error rates"

2. AWS Health Dashboard – Your Account Events (Personalized)

- URL: <https://health.aws.amazon.com>
- Requires login to AWS Console
- Provides **account-specific issues**
 - e.g., EC2 instance scheduled for retirement
 - RDS failover events
 - IAM access alerts

What Events Does It Show?

Event Type	Description
Open	Ongoing issues or planned events
Upcoming	Future events (e.g., scheduled maintenance)
Closed	Resolved events
Account-specific	Impacts only your account (e.g., EC2 stop notices)
Service-specific	Broad service events in AWS regions

Example Events

- EC2 instance retirement notice

- RDS scheduled maintenance window
 - IAM root user login from new location
 - S3 access delays in a specific region
 - Quota breaches on Lambda invocations
-

How is It Different from CloudWatch?

Feature	AWS Health Dashboard	CloudWatch
Focus	AWS infrastructure health	Resource metrics
Scope	Account + region level	Instance/app level
Alerts on	AWS service issues	Custom metrics & thresholds

Hands-On Lab: Use the AWS Health Dashboard

◆ Step 1: View Global AWS Service Health

1. Go to  <https://health.aws.amazon.com/health/status>
 2. Explore regional tabs and view ongoing issues
 3. Filter by:
 - Service name (e.g., EC2)
 - Region (e.g., us-east-1)
-

◆ Step 2: Check Personal Health Dashboard (Account-Specific)

1. Login to the AWS Console
 2. Navigate to 🖱️ <https://health.aws.amazon.com>
 3. View:
 - Open issues
 - Upcoming changes
 - Recently closed issues
-

◆ Step 3: Simulate an Event (Optional for Practice)

Since you can't force a real AWS issue, you can simulate by:

- Scheduling a maintenance window on RDS or EC2
 - Triggering a service quota alert (e.g., deploy too many Lambdas)
 - Subscribing to **Health Events via CloudWatch Events + SNS** for alerts
-

🔔 Optional: Get Notifications

1. Go to **Amazon EventBridge**
2. Create a rule for:
 - Event source: `aws.health`

3. Set target as an **SNS topic**
4. Subscribe your email to the topic

Now you'll get email alerts for account-specific AWS Health events!

Summary

Feature	Details
What	Real-time alerts for AWS events
Scope	Public + account-specific
Where to access	health.aws.amazon.com
Use case	Get notified of outages, maintenance, and service changes
Automation	Use EventBridge to trigger Lambda, SNS, or logs
